RUMANIA/Magnetism - Ferromagnetism.

F-

Abs Jour : Ref Zhur Fizika, No 3, 1960, 6253
Author : Procapiu Stefan, Lutovan Vasile
Inst : University of Iasi, Bucharest, Rumania
Title : Change in the Permeability of Iron Wires under the
Influence of Tension up to and above the Elastic Limits.
Orig Pub : Studii si cercetari stiint, Acad. RPR Fil. Iasi. Fiz. si
stiinte tehn., 1958, 9, No 1, 11-15
Abstract : The hysteresis loops of iron wires, first subjected to
elastic deformation (first state) and then to plastic
deformation (second state) were measured. The measure-
ments were carried out by a ballistic method. Data are
given on the variation of the principal hysteresis cha-
racteristics with such a treatment. The maximum permea-
bility increases with tension by approximately 30% up to

Card 1/2

RUMANIA/Magnetism - Ferromagnetism.

F-

a tension of 20 kg/mm² for wire in the first state.
For wires in the second state, the maximum permeability
increases approximately by a factor of 3 with increasing
stress up to 20 kg/mm². Tension above 20 kg/mm² causes
a reduction in the maximum of permeability for both sta-
tes. -- A.V. Zaleskiy

On Measuring the Real Surface of Metal (During the Process of Pickling Aluminium Foil in Condenser Manufacture).

A method was developed based on the double electrical layer at the boundary of two phases for determining the relative magnitude of the real surface of a metal which is applicable for continuous measurement of the pickling coefficient of aluminium foil during the process of dynamic pickling. The here described method permits to make the correction of the pickling process fully automatic.

"Relations Between the Deformation Process in Plastic Deformation and the Geometry of the Forming Tool"

Budapest, Kohászati Lapok, Vol 99, No 5, May 1966, pp 193-203.

Abstract: It was shown that a precise solution of plastic deformation problems cannot be obtained with the aid of the Hooke law or the Mohr theorem. It was furthermore shown that the principal parameter of plastic deformation is the acceleration which determines the velocity and the trajectory of the elementary particles. The theoretical investigation of the relationships involved resulted in the derivation of an equation for the characterization of the optimum forming conditions. In order to attain these optimum forming conditions it is necessary to shape tool so that this becomes possible. Under most circumstances this can be achieved by shaping the tool on the basis of a hyperboloidal configuration.

PROCHAZKA A. Vychovna akce proti kojenecké umrtnosti Educational measures against infantile mortality Prakticky Lekar 1947, 27/2 (41-42)

Infantile mortality is very high in Czechoslovakia. This is due to the shortage of doctors and public health workers, the lack of adequate welfare centres and hospitals, and the miserable economic conditions; these conditions are of very serious nature and cannot be cleared up as quickly as is desired, in spite of all efforts in that direction. One part of the campaign must, however, be undertaken without delay; that is the training of girls in mothercraft, with instruction in the care of infants by modern methods and encouragement to make use of the hygienic and social services. All women who have anything to do with the bringing up of children, must be educated. It is proposed to conduct a nation-wide action making use of broadcasting, press, films, lectures, talks, posters, pamphlets, advertisements and cooperation with all professional organizations.

1740. THE SITUATION OF PATIENTS WITH POLIOMYELITIS COMPLICATED
IN THE ACUTE STAGE BY SWALLOWING DISTURBANCES - L'état actuel
des malades poliomyélitiques compliqués au début de la maladie par les
troubles de respiration et d'agglutition - Prochazka, Adam E. and
Adamova V. - EUR. ASS. AGAINST POLIO, VII EUR. SYMP. OF POLIO
(Madrid, September 1958) Tables 1

From 1951-1957, 1041 patients with poliomyelitis were hospitalized in Prague; 133
of them had respiratory disturbances. The mortality in this group was 48%. In 78
cases artificial respiration was performed; 25 patients died, 26 patients suffered
from disturbances in the swallowing mechanism. If death occurs in chronic respi-
ratory cases, this is mainly due to intercurrent infections in the lungs or in the
urinary tract (lithiasis).

Radioactive phosphorus is accumulated quicker and in bigger quantities by the cells of cervical cancer than by normal cells. In order to make possible direct counting of impulses at the cervix without previous biopsy, the authors constructed a modified β counter, which is described in detail. It is a glass tube with an internal copper tube serving as cathode and a tungsten wire serving as anode. After i. v. injection of P^{32} , the impulses from cervixes with cancer were significantly higher for 7 days than from cervixes with glandular erosions or from the upper lip. This β counter can also be used for the detection of lymph node metastases, for the differential diagnosis of cystic mastopathy and breast cancer, and for the detection of its axillary lymph node metastases. This method is not intended to replace biopsy, but to supplement it.

"Changes in the Pattern of Lactic Dehydrogenase Isoenzymes in
Experimental Gastric Lesions."

Prague, Casopis Lekaru Ceskych, Vol 105, No 49-50, 9 Dec 66, pp
1359 - 1364

Abstract / Authors' English summary modified 7: Experiments with
rats were conducted. Ratio of individual LDH isoenzymes is a
function of changes produced by anaerobic glycolysis and oxidat-
ive cycles. Fundic mucosa and pyrolytic mucosa show a physio-
logical difference with LDH isoenzymes. Near lesions LDH 1 in-
creases and LDH 5 increases. 9 Figures, 1 Table, 9 Western, 2
